AtliQ Sales Memory Assistant

An AI assistant that remembers every client promise, so busy founders don't have to

Venkat · Codebasics AI PM Capstone · October 2026

The story in one slide

Problem

Follow-ups live in founders' heads and inboxes. Only about 1 in 6 happens on time, and USD 405k of deals has stalled.

Opportunity

AtliQ already has the answers in its email and notes. AI can read them and turn them into dated, owned tasks.

Solution

A daily brief of at most 7 items per person. Each item shows its source sentence and comes with a draft reply.

Result

A working prototype with 12 of 12 checks passing. It costs about USD 455 a month to run, and AI is only USD 6.5 of that.

Leads and promises are leaking out of the pipeline

0 of 40

CRM records have a follow-up date, so nobody is reminded of anything

USD 405k

sits in 7 valued deals that have stalled or been forgotten

21 days

FinEdge, the biggest deal at USD 95k, waited for a reply to its email

4 leads

wrote in (Harbor & Finch, Nimbus, Lumino, PixelWorks) and never reached the CRM

Source: the provided CRM export (40 records) and 50 emails and meeting notes. Dataset date: Friday 10 July 2026.

Who we built for: the founder-seller

Bhavin, Dhaval, Karandeep

Founders who sell, deliver and run the company. Jay supports sales and keeps the CRM.

"We find out what's urgent by accident."

Goals

- Close the right deals fast, without letting a warm lead go cold
- Grow revenue from happy clients
- Spend less time on CRM admin

Pains

- Calls and replies happen on the phone and never reach the CRM
- Promises slip: ByteBridge case studies are 56 days late
- Jay spends about 2 hours rebuilding the CRM before each review

Success looks like

- Every open deal has a next step, a date and an owner
- Clients get a reply within 2 working days
- Every new lead is in the CRM within 24 hours

Discovery: the pipeline leaks at seven points

Capture	Log	Follow up	Propose	Close	Grow	Revisit
Never entered	**Thin records**	**Promises slip**	**Questions wait**	**CRM is wrong**	**Cross-sells lost**	**Lost stays lost**
4 inbound leads not in the CRM	MedTrack: “dashboards? or LIMS? both?”	ByteBridge case studies, 56 days late	Meridian waiting 24 days	Trustline said yes; CRM says Proposal Sent	Acme asked about forecasting	Quantia: “check back Q2 2026”

Insight: every leak has the same shape. The facts are already written down in an email or note, but nothing turns them into a task with a date and an owner.

Root cause: the CRM depends on memory

1. Why did FinEdge (USD 95k) wait 3 weeks? Nobody noticed its email needed action.
2. Why didn't the CRM flag it? It only knows what someone types in.
3. Why isn't it updated? Updating is a separate step, done later at a laptop.
4. Why didn't “update the CRM same day” work? Founders have no spare time. It failed in April and again in July.
5. Why is there no safety net? The CRM is passive storage. It never reads email or reminds anyone.

Problem statement

AtliQ's founder-sellers need a way to capture and act on every sales conversation without extra effort. Today the CRM depends on them remembering and retyping what was said, so promises slip, referrals go cold, cross-sells go unnoticed and lost deals are never revisited.

We scored 16 ideas and chose five to build

Build now

F1 **Lead catcher**
Spots new leads in email and drafts the CRM record

F2 **Promise and deadline tracker**
Turns “by Friday” into a dated task with an owner

F3 **Waiting-on-us radar**
Flags unanswered client emails and fixes stale statuses

F4 **Cross-sell and revisit spotter**
Catches new needs and “try again later” dates

F5 **Daily brief with draft replies**
One short list each morning; a person sends

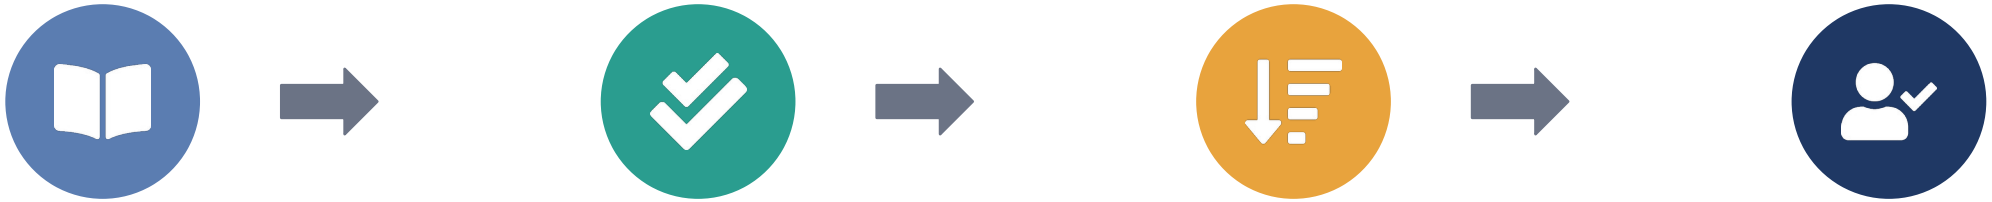

Park for version 2

- Business card and voice note capture: no samples to test with
- Proposal and questionnaire writer: a wrong answer is a legal risk
- Objection helper: needs a case-study library first

Don't build

- Win-probability score: 40 records is too little history
- AI that emails clients itself: one wrong email costs a deal
- Meeting bot: consent and privacy, and many calls are by phone

How it works: AI reads, rules decide, people approve

1. Read

Claude Haiku 5.5 reads each email and note and lists promises, questions, deadlines and leads, each with the exact sentence it came from.

2. Verify

A plain checker looks for every quote word-for-word in the source. No match means the item is hidden. Unknown values say “Not stated”.

3. Rank

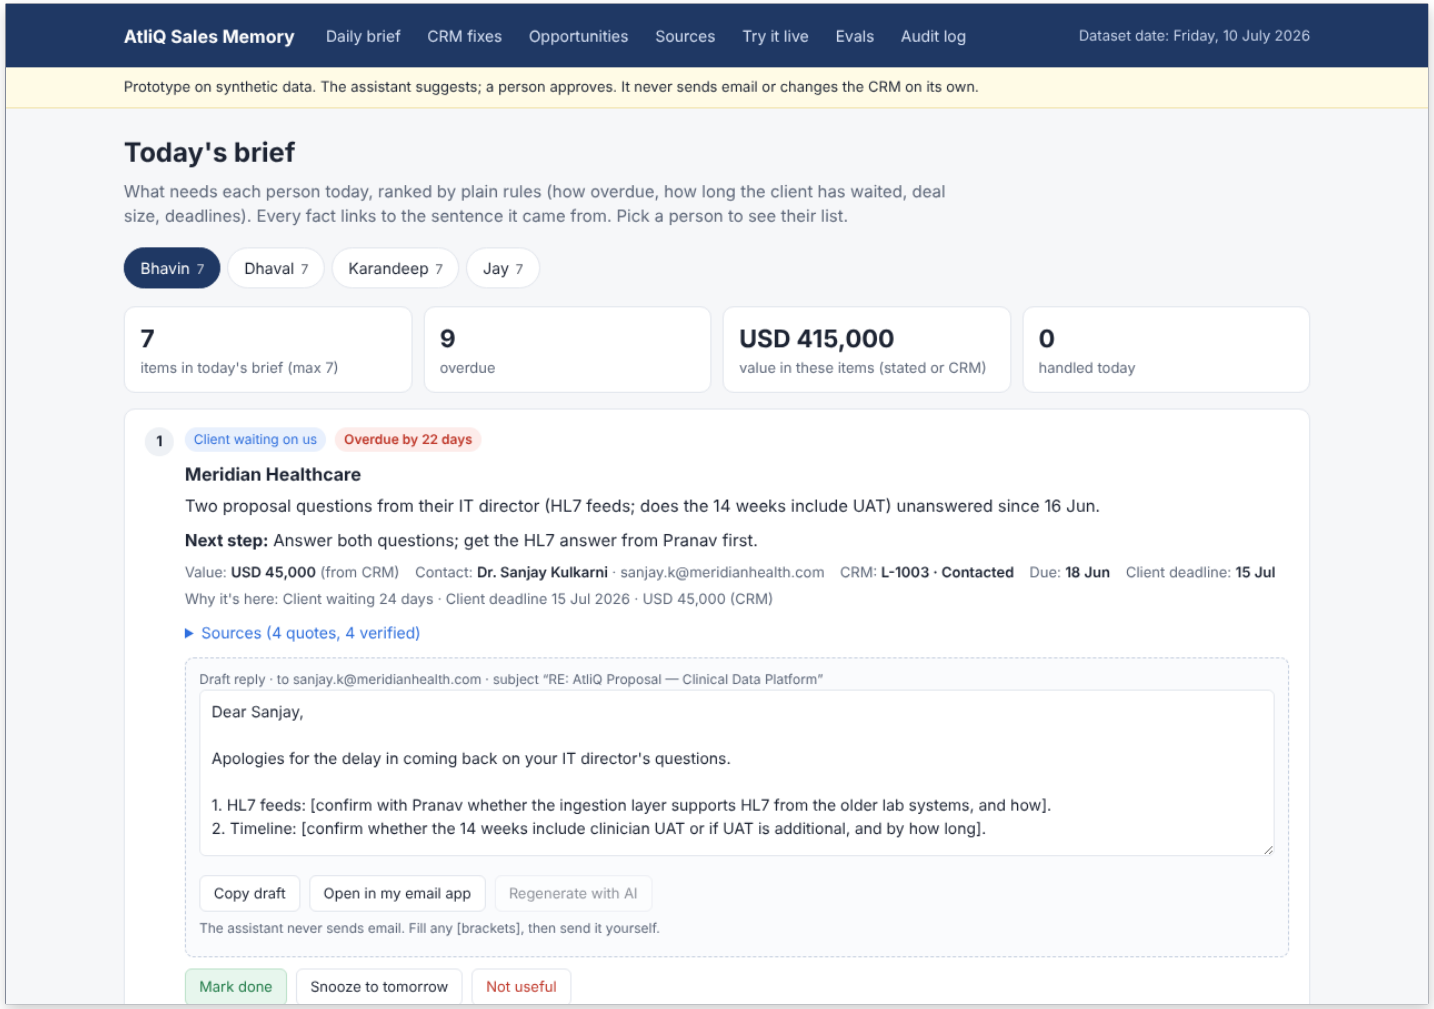

Simple rules set due dates (client questions: 2 working days) and order the list by days overdue, deadline and deal value. At most 7 per person.

4. Approve

Claude Sonnet 5.5 drafts replies. A person edits and sends them, and approves every CRM change. Every click is logged.

Why this split: AI does the reading, which it is good at. The decisions that must be predictable and explainable (what is due, what comes first) stay in plain rules anyone can check.

Walkthrough: each founder's daily brief

1. **Pick a person**
   Bhavin, Dhaval, Karandeep or Jay. Each sees at most 7 items.

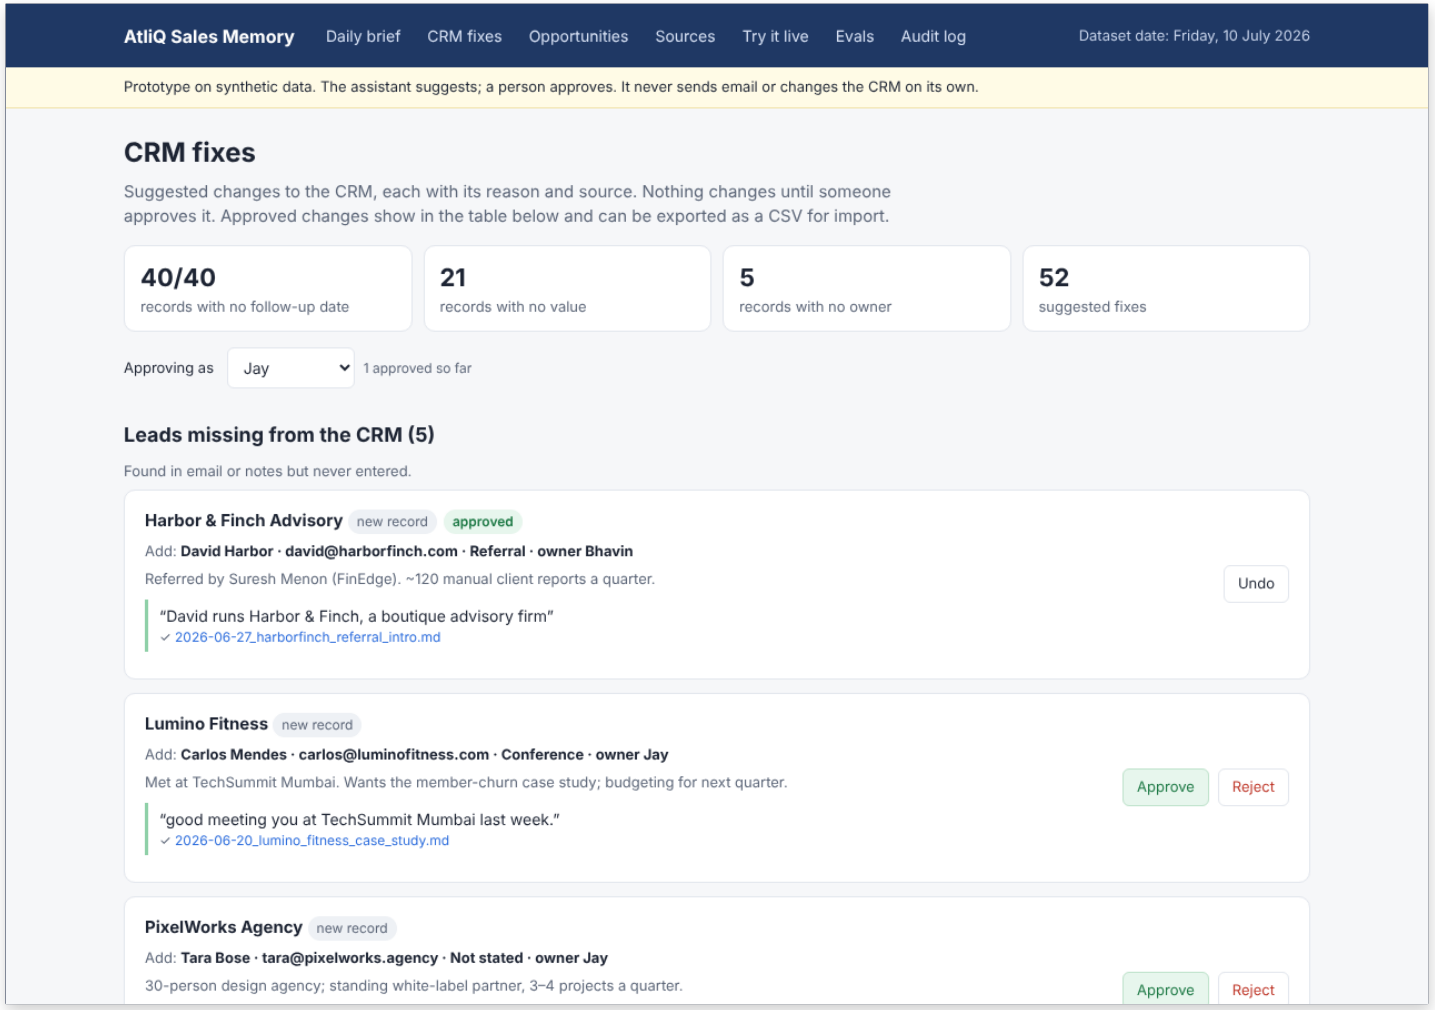

2. **See why it's here**
   Meridian: client waiting 24 days, deadline 15 July, USD 45k.

3. **Check the source**
   Every fact opens to the sentence it came from, marked verified.

4. **Send the reply yourself**
   Edit the draft and copy it. Unknown facts stay as [brackets].

5. **Mark done, snooze or "not useful"**
   Each choice is logged and tunes the list.

Walkthrough: CRM fixes need a person's click

1

Missing leads
Harbor & Finch, Lumino, PixelWorks, Nimbus and Ridgeline, drafted from their emails.

2

Duplicates
Meridian (L-1003 and L-1027) and GlobalMart are flagged, not merged.

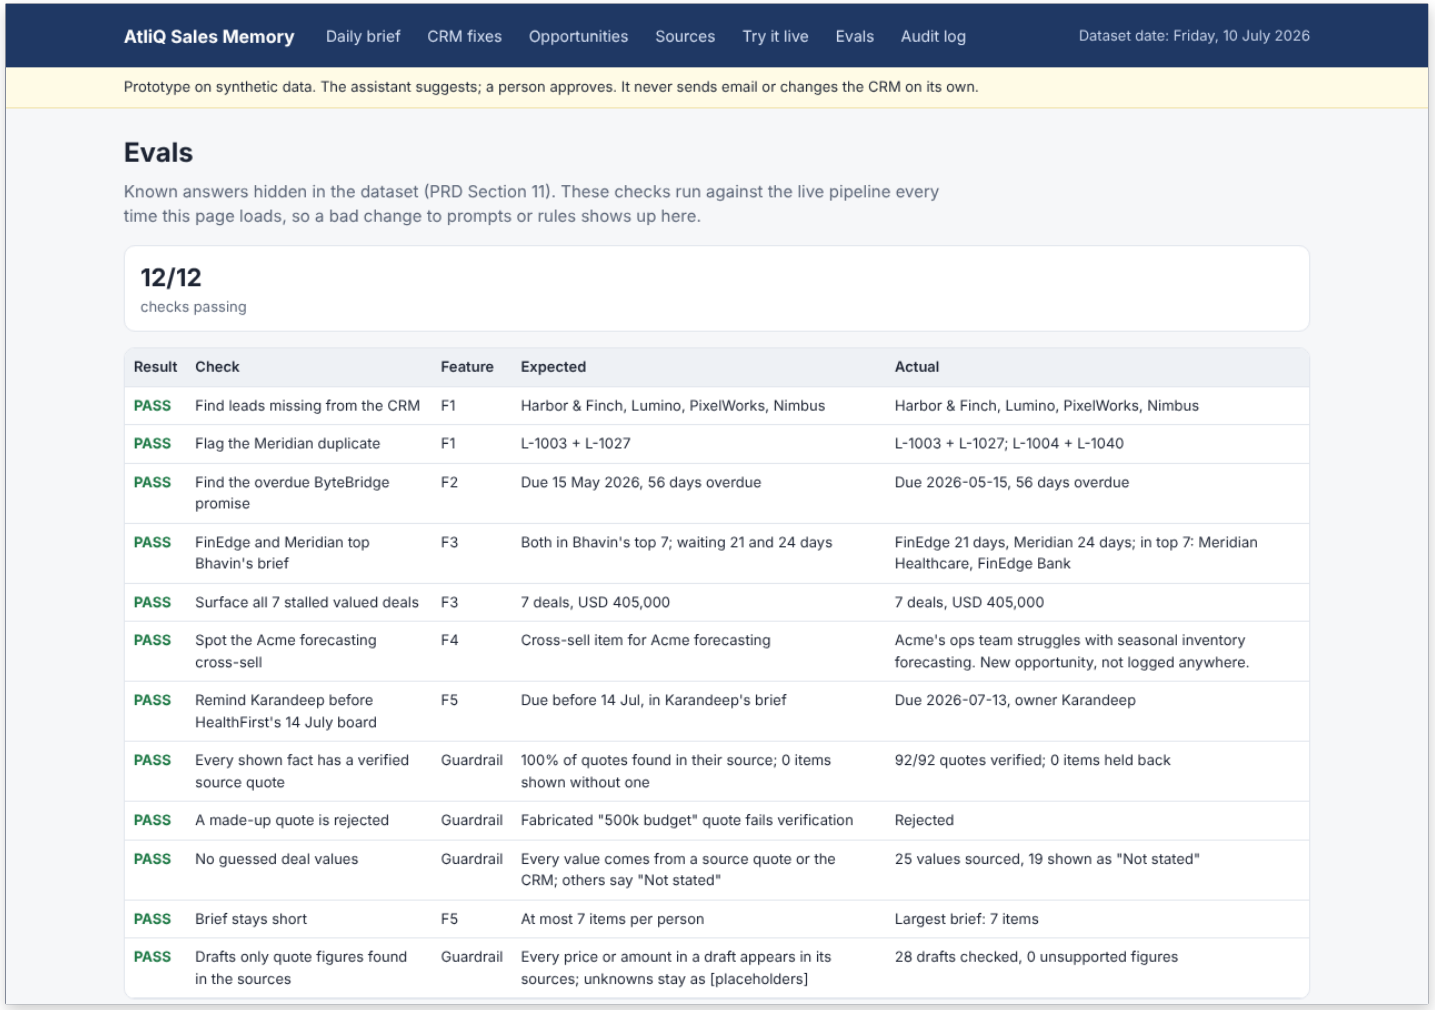

3

Wrong statuses
Trustline is won and Kaveri is live again, so status changes are suggested.

4

Approve, reject or undo
Nothing changes until someone approves. The result exports as a CSV.

Walkthrough: proof that it can be trusted

AtliQ Sales Memory | Daily brief | CRM fixes | Opportunities | Sources | Try it live | Evals | Audit log | Dataset date: Friday, 10 July 2026

Prototype on synthetic data. The assistant suggests; a person approves. It never sends email or changes the CRM on its own.

Evals

Known answers hidden in the dataset (PRD Section 11). These checks run against the live pipeline every time this page loads, so a bad change to prompts or rules shows up here.

12/12
checks passing

Result	Check	Feature	Expected	Actual
PASS	Find leads missing from the CRM	F1	Harbor & Finch, Lumino, PixelWorks, Nimbus	Harbor & Finch, Lumino, PixelWorks, Nimbus
PASS	Flag the Meridian duplicate	F1	L-1003 + L-1027	L-1003 + L-1027; L-1004 + L-1040
PASS	Find the overdue ByteBridge promise	F2	Due 15 May 2026, 56 days overdue	Due 2026-05-15, 56 days overdue
PASS	FinEdge and Meridian top Bhavin's brief	F3	Both in Bhavin's top 7; waiting 21 and 24 days	FinEdge 21 days, Meridian 24 days; in top 7: Meridian Healthcare, FinEdge Bank
PASS	Surface all 7 stalled valued deals	F3	7 deals, USD 405,000	7 deals, USD 405,000
PASS	Spot the Acme forecasting cross-sell	F4	Cross-sell item for Acme forecasting	Acme's ops team struggles with seasonal inventory forecasting. New opportunity, not logged anywhere.
PASS	Remind Karandeep before HealthFirst's 14 July board	F5	Due before 14 Jul, in Karandeep's brief	Due 2026-07-13, owner Karandeep
PASS	Every shown fact has a verified source quote	Guardrail	100% of quotes found in their source; 0 items shown without one	92/92 quotes verified; 0 items held back
PASS	A made-up quote is rejected	Guardrail	Fabricated "500k budget" quote fails verification	Rejected
PASS	No guessed deal values	Guardrail	Every value comes from a source quote or the CRM; others say "Not stated"	25 values sourced, 19 shown as "Not stated"
PASS	Brief stays short	F5	At most 7 items per person	Largest brief: 7 items
PASS	Drafts only quote figures found in the sources	Guardrail	Every price or amount in a draft appears in its sources; unknowns stay as [placeholders]	28 drafts checked, 0 unsupported figures

1. **12 of 12 checks pass**
   Known answers hidden in the dataset are re-checked every time the page loads.

2. **92 of 92 quotes verified**
   A made-up “500k budget” quote is caught and rejected.

3. **No guessed values**
   25 values are sourced, and the other 19 say “Not stated”.

4. **Try it live**
   Paste a new email and the same checks run on what the AI finds.

North Star: follow-ups done on time

On-time follow-up rate

Client questions, our promises and new leads acted on by their due date, divided by all that were due.

~17%	today (about 1 in 6)
80%	in 8 weeks
90%	in 6 months

Supporting metrics

Deals with a next step and date
0 of 40 → 90%

New lead in CRM
within 24 hours

Median client wait
2 working days or less

CRM admin time
2 hours → 20 minutes

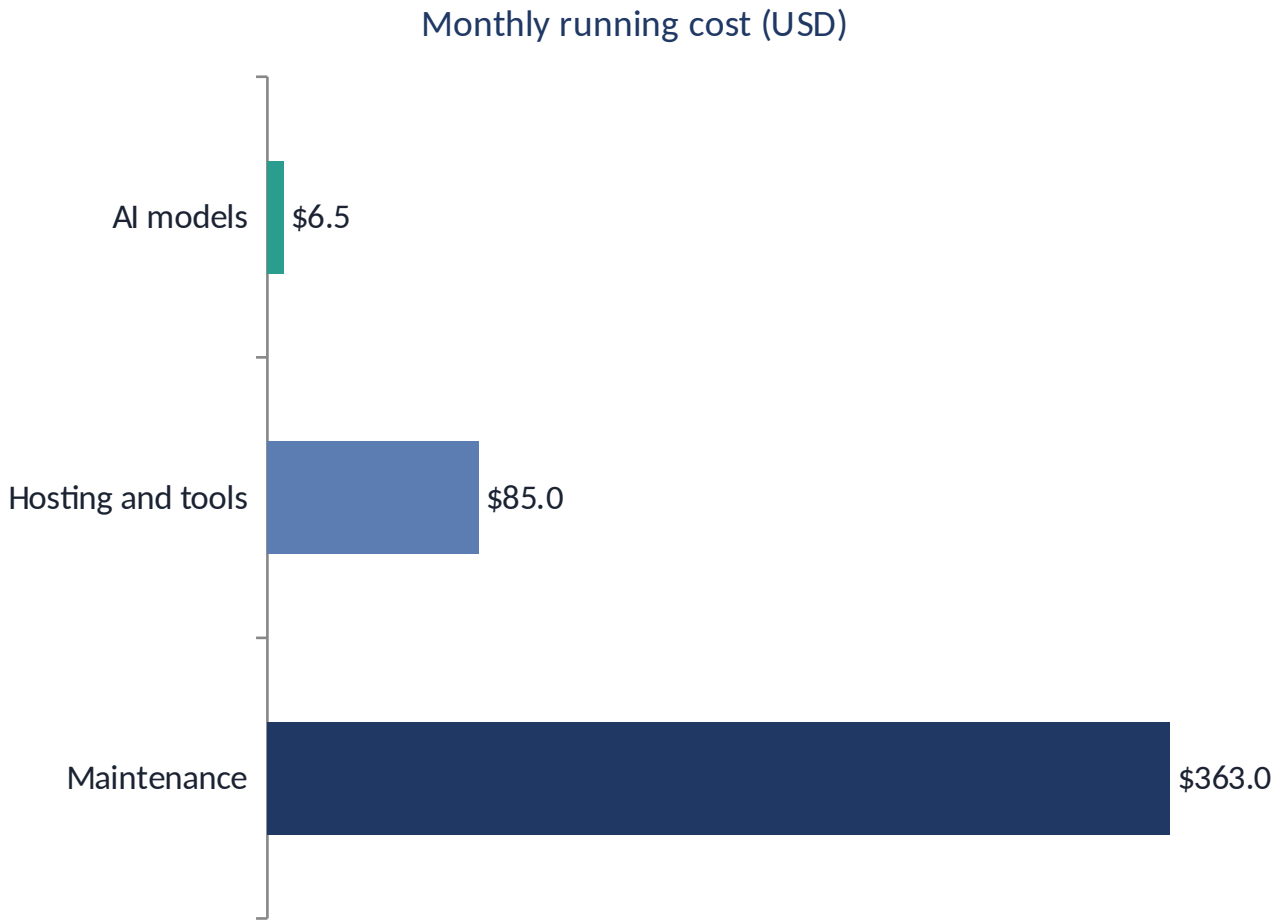

Facts backed by a source
95% or more

Stalled pipeline revived
USD 200k of 405k in 90 days

Guardrail metrics (must hold)

0 emails sent or CRM changes made without a person · at most 7 items per brief · under 30% of suggestions rejected

It costs about USD 455 a month to run

USD 6.5 a month for AI: Haiku 5.5 reads, Sonnet 5.5 drafts

USD 7,200 one-time build cost

~9 months to pay back from founder time saved

USD 31 a month even if we used the top model (Opus 5.5) everywhere

Risks, and the guardrails that handle them

Risk	Guardrail in the product	How we check it
AI makes up a fact or a number	An item is shown only if its quote is found word-for-word; unknown values say “Not stated”	95% or more of facts backed by a source; fake-quote eval
A wrong email reaches a client	There is no send button. The person edits and sends the draft from their own email	0 emails sent without a person
A bad suggestion corrupts the CRM	Every change needs Approve, can be undone, and is logged with who and when	0 CRM changes without a person
Too many alerts, so people stop reading	At most 7 items per person, ranked by plain rules; the rest sit under “See all”	Brief open rate; under 30% rejected
AI misses a promise	Known-answer evals run on every change; “Not useful” feedback is reviewed weekly	Under 10% of promises missed
Client data goes where it shouldn't	Only the email being read and matching CRM rows are sent to the model; sales mail only	Monthly access review

Rollout plan and next steps

Alpha

13–24 Jul

Run on the sample dataset; tune prompts and rules against the evals

Beta

27 Jul–21 Aug

Dhaval uses the brief, promise tracker and radar (F2, F3, F5) daily

Phased rollout

24 Aug–18 Sep

All founders; adds the lead catcher (F1) and CRM write-back

Full release

30 Sep

Everyone; the cross-sell spotter (F4) follows after version 1

Before a real launch

- Connect live Gmail and the CRM instead of the frozen sample files
- Move decisions and the audit log to a server, with sign-in for each founder
- Review real “Not useful” feedback weekly and grow the eval set from it

Thank you

Nothing slips, the CRM stays right, and a person always presses Send.
